## NOVEL HUMAN PROTEASES AND POLYNUCLEOTIDES ENCODING THE SAME

The present application claims the benefit of U.S.

Provisional Application Number 60/171,566 which was filed on

December 22, 1999 and is herein incorporated by reference in its entirety.

## 1. INTRODUCTION

The present invention relates to the discovery, identification, and characterization of novel human polynucleotides encoding proteins sharing sequence similarity with mammalian proteases. The invention encompasses the described polynucleotides, host cell expression systems, the encoded protein, fusion proteins, polypeptides and peptides, antibodies to the encoded proteins and peptides, and genetically engineered animals that either lack or over express the disclosed sequences, antagonists and agonists of the proteins, and other compounds that modulate the expression or activity of the proteins encoded by the disclosed polynucleotides that can be used for diagnosis, drug screening, clinical trial monitoring and the treatment of physiological disorders.

## 2. BACKGROUND OF THE INVENTION

Proteases cleave protein substrates as part of degradation,

maturation, and secretory pathways within the body. Proteases
have been associated with, inter alia, regulating development,
modulating cellular processes, fertility, and infectious disease.

## 3. SUMMARY OF THE INVENTION

The present invention relates to the discovery, identification, and characterization of nucleotides that encode novel human proteins, and the corresponding amino acid sequences of these proteins. The novel human proteins (NHPs) described for the first time herein share structural similarity with animal
